The `numpy_array_to_blob` function is a Python utility that allows you to convert a NumPy array to a blob and insert it into an SQLite database. It uses the `sqlite3` module to connect to the database and perform the insertion.

The function accepts the following parameter:

`image_array`: The image array to be converted to a blob and inserted into the database.

The function does not provide any output or return value. It performs the conversion and insertion into the SQLite database.

The `sqlite3` module handles errors related to database connectivity and SQL execution. In case of any errors, appropriate exceptions will be raised.
